

## Hendor introduces new high quality wound cartridges

At Hendor we are continuously working on improvement and innovation. Innovation in and for new products, but also of current products. For many years, the high quality wound Hendor filter cartridges have been manufactured in the same factory. In this factory the highest standards and raw materials were used. Unfortunately, this plant is going to be closed. To maintain the high quality standards, Hendor's QC department started an investigation to find an, at least, equal successor. After careful and thorough evaluation, we are pleased to announce that a new plant is found. Also this plant is capable of manufacturing the high quality Hendor cartridges. Yet, the new wound cartridges have a different appearance. The visual differences are shown in below pictures, but have no impact on the quality. The quality remains high and reliable.

The key advantages of Hendor wound cartridges are:

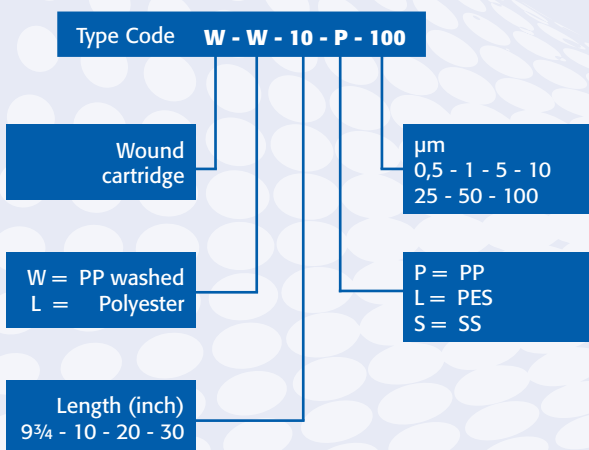

- High flow @ low initial  $\Delta p$
- High dirt holding capacity
- Long life time

The new cartridges also have a different pack size. The quantity per box changes to:

- 10" length have 60 off per box
- 20" length have 30 off per box
